

TECHATRONICS

Instrumentation, Automation, Design, and Service

Instrumentation Automation and Design

Techatronics is an Engineering Firm that specializes in the Automation and Design of Measurement Equipment.

We merge the latest techniques in software with precision engineering to control and automate your entire lab or factory.

Instrumentation Automation

Measurements have got to be one of the most important processes in any processing plant. Any decision made on what your plant or lab should do is based on what measurements tell us. In the context of process control, all controller decisions are similarly based on measurements.

We offer our clients process automation and control solutions to meet your custom needs – from stand-alone processes that need basic, reliable functionality, to complex integrated enterprises that control critical or hazardous operations.

Instrumentation Design

Our technology know-how and application experience enable us to develop measurement and analytical instruments, and systems that deliver the proven performance and reliability you expect.

Techatronics manages the entire instrument design cycle, from finalizing the design specifications, to driving the development and manufacturing process using the right team for the job. Our knowledge and experience ensures a fast, effective, and efficient process.

Techatronics designs and builds custom equipment for many industries from Tobacco, Medical, and Biotech to Pharmaceutical. We design turnkey instruments that are easy to install, operate, and maintain with minimal engineering support.

Instrumentation Service

Our service division offers world-class service and repair. We have extensive experience in a wide variety of analytical and measuring equipment from initial setup and calibration to routine service and repair.
